1.1 Module description

1.1.1 What is PyCrop2ML?

PyCrop2ML is a free, open-source library for defining and exchanging CropML models. It is used to generate components of modeling and simulation platforms from the CropML specification and allow component exchange between different platform.

It allows to parse the models described in CropML format and automatically generate the equivalent executable Python, java, C#, C++ components and packages usable from existing crop simulation platform.

1.1.2 What is Crop2ML ?

CropML is a XML-(JSON-)based language used to represent different biological processes involved in the crop models.

CropML project aims to provide common framework for defining and exchanging descriptions of crop growth models between crop simulation frameworks.

Objectives

Our main objectives are:

- define a **declarative language** to describe either an atomic model or a composition of models
- add semantic dimension to CropML language by annotation of the models to allow the composition of components of different platforms by using the standards of the semantic web
- develop a library to allow the transformation and the exchange of CropML model between different Crop modelling and simulation platform
- provide a **web repository** enabling registration, search and discovery of CropML Models

- facilitate Agricultural Model Exchange Initiative

Context

Nowadays, we observe the emergence of plant growth models which are built in different platforms. Although standard platform development initiatives are emerged, there is a lack of transparency, reusability, and exchange code between platforms due to the high diversity of modeling languages leading to a lack of benchmarking between the different platforms.

This project aims to gather developers and plant growth modelers to define a standard framework based on the development of declarative language and libraries to improve exchange model components between platforms.

Motivation

Our motivation is to:

- Strengthen the synergy between crop modelers, users and scientific researchers
- Facilitate model intercomparison (at the process level) and model improvement through the exchange of model components (algorithms) and code reuse between platforms/models.
- Bridge the gap between ecophysiologicals who develop models at the process level with crop modelers and model users and facilitate the integration in crop models of new knowledge in plant science (i.e. we are seeking the exchange of knowledge rather than black box models).
- Increase capabilities and responsiveness to stakeholder' needs.
- Propose a solution to the AgMIP community for NexGen crop modeling tools.

Vision

- Facilitate the development of complex models
- Use modular modelling to share knowledge and rapidly develop operational tools.
- Reuse model parts to leverage the expertise of third parties;
- Renovate legacy code.
- Realize the benefit of sharing and complementing different expertise.
- Promote model sharing and reuse

1.1.3 CropML Description

In CropML, a model is either a model unit or a composition of models. A `ModelUnit` represents the atomic unit of a crop model define by the modelers. A model composition is a model resulting from the composition of two or more atomic model or composite models.

These models have a specific formal definition in CropML.

Formal definition of a Model Unit in CropML

The structure of a Model Unit in CropML MUST be conform to a specific Document Type Definition named `ModelUnit.dtd`.

So a Model Unit CropML document is a XML document well-formed and also obeys the rules given in the ModelUnit structure.

This structure MAY be described by the below tree:

Element	Description
ModelUnit	The root of an atomic model in CropML which make the difference from a composite model.
Description	some basic information related to the name of the model, its authors and others elements used to reference it.
Inputs	A list of inputs characterized by their names, initial states, the range of values and others. Its input variables are related to climate, soil and cropping system
Outputs	A list of outputs defining the processes involved, the variables whose dynamics we want to observe.
Algorithm	The description of the behaviour of the model made by the mathematical relationship between the inputs and the outputs with some control structure.
Parametersets	Some sets of parameters which are invariant and used for the simulation of the models.
Testsets	Set of model configuration used to compare estimated and desired outputs .

In the next, we define the major elements of a CropML model unit.

ModelUnit element

An atomic model in CropML is declared with `<<ModelUnit>>` element, the usual root of CropML ModelUnit document.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE ModelUnit PUBLIC "-//SIMPLACE/DTD SOL 1.0//EN" "https://raw.
↳githubusercontent.com/AgriculturalModelExchangeInitiative/xml_representation/master/
↳ModelUnit.dtd">
<ModelUnit modelid=" " timestep=" " name=" " version=" ">
    ....
</ModelUnit>
```

This element MUST contain a Description, an Algorithm, Parametersets and Testsets elements and MAY optionally have Inputs and Outputs elements. The restriction of the length of different lists is not imposed.

ModelUnit element MUST have an modelid and name attributes which are used to reference an atomic model. It MUST also contain a timestep attribute to define the temporality of the model and a version attribute for each version of the model.

Description element

This element gives the general information on the model and is composed by a set of character elements. It MUST contain Title, Authors, Institution and abstract elements and MAY optionally contain URI and Reference elements.

```
<ModelUnit modelid=" " timestep=" " name=" " version = " ">
    <Description>
        <Title>title</Title>
        <Authors>authors</Authors>
        <Institution>institution</Institution>
        <URI>uri</URI>
        <Abstract><![CDATA[abstract]]></Abstract>
    </Description>
    ...
</ModelUnit>
```

Inputs elements

The inputs of Model are listed inside an XML element called Inputs within a `dictionary structure` composed by their attributes which declarations are optional(default, max, min, parametercategory, variablecategory and uri) or required(name, datatype, description, inputtype, unit) and their corresponding value. *Inputs* element MUST contain one or more *Input* elements.

```
<ModelUnit modelid=" " timestep=" " name=" " version = " ">
    ...
    <Inputs>
        <Input name=" " description=" " parametercategory=" " datatype=" " min=" " max=
↳" " default=" " unit=" " uri=" " inputtype=" "/>
```

(continues on next page)

(continued from previous page)

```

    <Input name=" " description=" " parametercategory=" " datatype=" " min=" " max="
    ↪ " " default=" " unit=" " uri=" " inputtype=" "/>
    ...
  </Inputs>
  ...
</ModelUnit>

```

- The required *datatype* attribute is the type of input value specified in *default* (the default value in the input), *min* (the minimum value in the input) and *max* (the maximum value in the input). It MAY be one type of the set of types used in the existing crop modeling platform.
- The *inputtype* attribute makes it possible to distinguish the variables and the parameters of the model. So it MUST take one of two possible values: *parameter* and *variable*.
- The *parametercategory* attribute defines the category of parameter which is specified by one of the following values: *constant*, *species*, *soil* and *genotypic*.
- The *variablecategory* defines the category of variable depending on whether it is a *state*, a *rate* or an “auxiliary” variable. State variable characterize the behavior of the model and rate variable characterizes the changes in state variables.

Outputs element

The outputs of Model are listed inside an XML element called Outputs within a [dictionary structure](#) composed by their attributes which declarations are:

- optional(variabletype and URI)
- required(name, datatype, description, unit, max and min)
- and their corresponding value

Outputs MUST contain zero or more output elements.

```

<ModelUnit modelid=" " timestep=" " name=" " version =" ">
  ...
  <Outputs>
    <Output name=" " description=" " datatype=" " min=" " max=" " unit=" " uri=" "/
    ↪ >
    <Output name=" " description=" " datatype=" " min=" " max=" " unit=" " uri=" "/
    ↪ >
    ...
  </Outputs>
  ...
</ModelUnit>

```

The definition of different attributes is same as Input’s attributes.

Algorithm element

The *Algorithm* element defines the building block of CropML model unit and shows the computational method to determine the outputs from the inputs.

It consists of a set of mathematical equations (relation between inputs), loops and conditional instructions which are well structured in a specific *language*, the algorithm’s attribute.

```
<ModelUnit modelid=" " timestep=" " name=" " version=" ">
...
  <Algorithm language=" "><![CDATA[
    ...
  ]]>
</Algorithm>
...
</ModelUnit>
```

Parametersets element

Parametersets element contains one or more *Parameterset* elements that define the different ways of setting the model. Each *Parameterset* element MUST have *name* and *description* attributes that respectively represents the name and the description of each setting.

The different parameterset MUST contain a list of *Param* elements that show in attribute the name of the parameter (an input which inputtype equals *parameter*) and the fixed value of this one.

```
<ModelUnit modelid=" " timestep=" " name=" " version=" ">
...
  <Parametersets>
    <Parameterset name=" " description=" " uri=" "/>
    <Parameterset name=" " description=" " >
      <Param name=" ">value</Param>
      <Param name=" ">value</Param>
      ...
    </Parameterset>
    ...
  </Parametersets>
...
</ModelUnit>
```

Testsets element

Testsets element contains one or more *Testset* elements that define the different run for evaluating the outputs of the model.

Each *Testset* element MUST have *name*, *description* and *parameterset* attributes that respectively represents the name, the description of each run and the name of the parameterset related to the Testset. This one allow to retrieve the name and the value of different parameters includes in this parameterset.

The different Testset MUST contain a list of *InputValue* and *OutputValue* elements corresponding respectively to the values of inputs used in the run and the values of Outputs that will be asserted.

```
<ModelUnit modelid=" " timestep=" " name=" " version=" ">
...
  <Testsets>
```

(continues on next page)

(continued from previous page)

```

<Testset name="" parameterset = "" description="" uri = ""/>
<Testset name="" parameterset = "" description="" >
  <Test name="">
    <InputValue name="">value</InputValue>
    ...
    <OutputValue name="" precision ="">value</OutputValue>
    ...
  </Test>
  ...
</Testset>
...
</Testsets>
...
</ModelUnit>

```

Formal definition of a Composite Model in CropML

A Composite Model CropML is an assembly of processes which are described by a set of model units or a composition of models. Given a composite model is a model, this one has also inputs, outputs and internal state which describe the orchestration of different independent models composed.

The structure of a Composite Model in CropML MUST conform to a specific Document Type Definition named [ModelComposition.dtd](#).

The composition is represented as a directed port graph of models:

Vertices are the different models that form the composition.

Ports are the inputs and outputs of each model.

Edges are directed and connect one output port to an input port of another model.

It contains in addition to all Elements of a model unit a Composition Element for the composition of models.

This structure MAY be described by the below tree:

In the next, we define the major elements of a CropML model unit.

Inputs element

It MUST contain one or more *input* element which provide a set of independent models entries. If two or more input variables of independent models are the same (same unit, interval, description) a link should be made to one input variable of the composite model.

Outputs element

It MUST contain one or more *output* element which provide a set of independent models outputs or a result of a combination of models .

Composition element

It's a list of *models* elements which contains a list of *links* elements. Link provides the mechanism for mapping inputs declared within one modelUnit to output in another modelUnit, allowing information to be exchanged between the various atomic models in the composite model.

Algorithm element

The implementation differs from the platform:

- Discrete Events Models and Formalisms (RECORD)
- Actor model framework (OpenAlea)
- A sequence of algorithmic instructions witch implement the control flow (BIOMA)

1.1.4 PyCropML User Guide

Version 0.1.1

Release 0.1.1

Date Oct 07, 2020

This reference manual details functions, modules, and objects included in OpenAlea.Core, describing what they are and what they do. For a complete reference guide, see `core_reference`.

Warning: This “Reference Guide” is still very much in progress. Many aspects of OpenAlea.Core are not covered.

Manual

Note: The following examples assume you have installed the packages and setup your python path correctly.

Installation

```
conda install -c openalea pycropml
```

or

```
python setup.py install
```

```

pycropml.transpiler.nodeVisitor module

```
class pycropml.transpiler.nodeVisitor.NodeVisitor
```

```
    Bases: object
```

Define a method which browse the graph and call a methode constructed from the type of each node of the graph

```
    visit (node)
```

pycropml.transpiler.pseudo_tree module

```
class pycropml.transpiler.pseudo_tree.Node (type, **fields)
```

The new Node generated with specific properties. These properties are automatically set"

Example: Node(type='local', name='l', pseudo_type="int") to represent a int variable declaration

```
    y
```

pycropml.transpiler.version module

Maintain version for this package. Do not edit this file, use 'version' section of config.

```
pycropml.transpiler.version.MAJOR = 0
```

(int) Version major component.

```
pycropml.transpiler.version.MINOR = 0
```

(int) Version minor component.

```
pycropml.transpiler.version.POST = 2
```

(int) Version post or bugfix component.

from pycropml import composition from pycropml.pparse import model_parser from path import Path im-
port networkx as nx from collections import defaultdict from IPython.display import Image, display from net-
workx.drawing.nx_pydot import to_pydot from pycropml.render_cymml import signature
```

```
class pycropml.package.AbstractPackageReader (filename)
    Bases: object
```

Abstract class to add a package in the package manager.

```
register_packages (pkgmanager)
    Create and add a package in the package manager.
```

```
class pycropml.package.Package (name, metainfo, path=None)
    Bases: pycropml.package.PackageDict
```

A Package is a dictionary of node factory. Each node factory is able to generate node and their widgets. Meta informations are associated with a package.

```
add_modelunit (modelunit)
    Add to the package a factory ( node or subgraph )
```

```
get_crop2ml_path ()
    Return the full path of the wrlea.py (if set)
```

```
get_id ()
    Return the package id
```

```

get_metainfo (key)
    Return a meta information. See the standard key in the __init__ function documentation. :param key: todo

get_modelunit (modelid)
    Return the factory associated with id

get_names ()
    Return all the factory names in a list

get_pkg_files ()
    Return the list of xml filename of the package. The filename are relative to self.path

get_tip ()
    Return the package description

is_directory ()
    New style package. A package is embeded in a unique directory. This directory can not contain more than
    one package. Thus, you can move, copy or delete a package by acting on the directory without ambiguity.
    Return True if the package is embeded in a directory.

is_editable ()
    A convention (for the GUI) to ensure that the user can modify the package.

mimetype = 'pypcrop2ml/package'

reload ()
    Reload all xml file of the package

remove_files ()
    Remove pkg files

update_modelunit (old_name, modelunit)
    Update factory (change its name)

class pypcropml.package.PackageDict (*args)
    Bases: dict

    Dictionnary with case insensitive key This object is able to handle protected entry begining with an '#'

get (k[, d]) → D[k] if k in D, else d. d defaults to None.

has_key (k) → True if D has a key k, else False

iter_public_values ()
    Iterate through dictionnary value (remove protected value)

nb_public_values ()
    Return the number of unprotected values

class pypcropml.package.PackageManager

add_crop2ml_path (path, container)
    Add a search path for wrlea files

    Parameters
    • path – a path string
    • container – set containing the path

add_package (package)
    Add a package to the pkg manager

```

```

clear ()
    Remove all packages

create_readers (crop2ml_files)

find_and_register_packages (no_cache=False)
    Find all composite model on the system and register them If no_cache is True, ignore cache file

find_crop2ml_dir (directory, recursive=True)
    Find in a directory wralea files, Search recursively if recursive is True

    :return : a list of pkgreader instances

get (*args)

get_pkgreader (filename)
    Return the pkg reader corresponding to the filename

has_key (*args)

init (dirname=None, verbose=True)
    Initialize package manager

    If dirname is None, find composition files on the system else load directory

items ()

iteritems ()

iterkeys ()

itervalues ()

keys ()

load_directory (dirname)
    Load a directory containing wraleas

rebuild_category ()
    Rebuild all the category

reload (pkg=None)
    Reload one or all packages. If the package pkg is None reload all the packages. Else reload only pkg.

set_sys_crop2ml_path ()
    Define the default composition files search path

    For that, we look for “composition” entry points and deprecated_wralea entry point if a package is declared
    as deprecated_wralea, the module is not load

update_category (package)
    Update the category dictionary with package contents

values ()

class pycropml.package.PseudoGroup (name)
    Bases: pycropml.package.PackageDict

    Data structure used to separate dotted naming (packages, category)

add_name (name, value)
    Add a value in the structure with the key name_tuple

get_id ()
    todo

```

```

    get_tip ()
        todo

    mimetype = 'pypcrop2ml/package'

    new (name)
        todo

    sep = '.'

class pypcropml.package.PyPackageReader (filename)
    Bases: pypcropml.package.AbstractPackageReader

    Build packages from wralea file Use 'register_package' function

    build_package (wraleamodule, pkgmanager)
        Build package and update pkgmanager

    filename_to_module (filename)
        Transform the filename ending with .py to the module name

    get_pkg_name ()
        Return the OpenAlea (uniq) full package name

    register_packages (pkgmanager)
        Execute model.py

class pypcropml.package.PyPackageReaderModel (filename)
    Bases: pypcropml.package.PyPackageReader

    Build a package from a __wralea__.py Use module variable

    build_package (wraleamodule, pkgmanager)
        Build package and update pkgmanager

    check_exist ()

    contain_pkg (pkg)

    get_path (pkg, name)

class pypcropml.package.PyPackageWriter (package)
    Bases: object

    Write a wralea python file

    get_str ()
        Return string to write

    pkg_template = '\n$PKGNAME\n$METAINFO\n'

    wralea_template = '\n# This file has been generated at $TIME\n$PKG_DECLARATION\n'

    write_wralea (full_filename)
        Write the wralea.py in the specified filename

exception pypcropml.package.UnknownNodeError (name)
    Bases: exceptions.Exception

class pypcropml.package.UserPackage (name, metainfo, path=None)
    Bases: pypcropml.package.Package

    Package user editable and persistent

pypcropml.package.get_default_home_dir ()
    Return the home directory (valid on linux and windows)

```

`pycropml.package.get_openalea_home_dir (name='.pycrop2ml')`

Return the crop2ml home directory If it doesn't exist, create it

`pycropml.package.get_userpkg_dir (name='user_pkg')`

Get user package directory (the place where are the wralea.py files). If it doesn't exist, create it

`pycropml.package.is_protected (item)`

Return true the item is protected

`pycropml.package.lower (item)`

`pycropml.package.protected (item)`

Return corresponding protected name for item

pycropml.parameterset module

class `pycropml.parameterset.Parameterset (name, description, uri=None)`

Bases: `object`

Parameter set

`pycropml.parameterset.parameterset (model, name, kwds)`

pycropml.writeTest_f90 module

Created on Thu Mar 28 15:39:28 2019

@author: midingoy

Add License, Header.

Use pkgllts

Problems: - name of a model unit?

```
class pycropml.writeTest_f90.Model2Package(models, dir=None)  
    Bases: object  
    TODO  
    DATATYPE = {'BOOLEAN': 'LOGICAL::', 'DATE': 'CHARACTER(65)', 'DATELIST': 'CHARACTER(6  
    generate_algorithm(model_unit)  
    generate_component(model_unit)  
        Todo  
    generate_estimation(model_unit)  
    generate_function_doc(model_unit)
```

generate_package()

Generate a csharp package equivalent to the xml definition.

Args: - models : a list of model - dir: the directory where the code is generated.

Returns: - None or status

generate_public_class(model_unit)

generate_test(model_unit)

num = 0

run()

TODO.

write_tests()

TODO: Manage several models rather than just one.

1.7.4 Mailing Lists

Our development mailing list is [[cython-dev|http://mail.python.org/mailman/listinfo/cython-dev|cython-dev]] and user mailing list at <http://groups.google.com/group/cython-users>.

In the past we also used a [[Google group|http://groups.google.com/group/cython|Google group]] and a list at [[BerliOS Developer|https://lists.berlios.de/mailman/listinfo/cython-dev|BerliOS Developer]]. You can still read [[the archives at Gmane|http://blog.gmane.org/gmane.comp.python.cython.devel|the archives at Gmane]].

1.7.5 Project Goals

- Fully supported easy-to-use test suite, including the normal CPython test suite.
- Easy installation and usage.
- Rich, accessible documentation. Make sure the examples are plenty and can be automatically tested.
- Make Cython part of the standard distribution of Python (like ctypes).
- Compile all Python code except for possibly some obvious exclusions, which will be worked out by developers.
- Very fast when the user explicitly declares types (but we're not going to make promises with type inference). Precise benchmarks.

- Mitigate or eliminate the need for users to invoke the Python/C API directly without sacrificing performance.

1.7.6 Documentation

- See <http://docs.cython.org/>.
- Official Pyrex [\[\[Language Overview|http://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/LanguageOverview\]\]](http://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/LanguageOverview) (note the [\[\[changes|http://hg.cython.org/cython/changes\]\]](http://hg.cython.org/cython/changes) though).
- [\[\[Extension Types|http://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/Manual/extension_types.html|Extension Types\]\]](http://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/Manual/extension_types.html)
- [\[\[Sharing Declarations Between Pyrex Modules|http://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/Manual/declarations_between_modules.html|Declarations Between Pyrex Modules\]\]](http://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/Manual/declarations_between_modules.html)
- [\[\[FAQ|http://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/FAQ.html|FAQ\]\]](http://www.cosc.canterbury.ac.nz/greg.ewing/python/Pyrex/version/Doc/FAQ.html)
